HOW THE DATA GETS HOME

JobPac's midnight detour

Every weekday at 2am, a cloud computer wakes up, walks all the way to the head office database, brings the day's numbers back, and puts itself to bed. The direct road is finally paved — it's just waiting on one gate to open — so for now, it's still **taking the scenic route**.

The nightly trip, station by station

Read left to right. Both roads now connect all the way through — one is just waiting for a name to be added to a guest list before it can carry real traffic.

Always-on / already working

Our temporary workaround — confirmed carrying traffic tonight

Connected, but one access-list entry still pending

Why there's still a detour

Every path to the database passes through the same head-office gatekeeper, **Sophos**, and from there a Site-to-Site VPN carries it the rest of the way to the DB2 server. The direct tunnel from our cloud account to Sophos is now **up and connected** — that part is done.

The one thing left is on the database's own doorstep: **Jobpac's DB2 still needs to add AWS's IP address to its access list** before it will accept a connection arriving that way. Until that's added, the nightly job keeps using the small always-on helper computer we stood up, which reaches Sophos the same way people already do by hand. We checked the Sophos–to–DB2 leg directly just now: it moved 304KB of real data in under two seconds, no drops, no stalls — this stretch of the road is in good shape. Once DB2's access list is updated, the detour gets switched off and traffic moves onto the direct road.

Tonight, at a glance

Schedule	Weekdays, 2:00am (Brisbane)
Current route	Temporary detour — active
Sophos → DB2 traffic check	304KB moved in 1.5s, just now
AWS ↔ Sophos tunnel	Connected
DB2 access list	*Waiting on AWS's IP to be added*
Last test run	Completed successfully
